**Patient Registry Data for Research: A Basic Practical Guide** Mohamad Adam Bujang,Ang Swee Hung,Tg Mohd Ikhwan Tg Abu Bakar Sidik ,Tassha Hilda Adnan ,Nadiyah Sa'at,Hon Yoon Khee,Alan Fong Yean Yip,2021-04-27 Analysis of patient data can be a complicated and challenging process, especially when the data involve many subjects and many variables. A patient registry is a database that organizes collecting the important set of data on a list of identifiable individuals for a specific disease. This type of data usually has tons of data and hundreds of different variables. Thus, the approach to conducting research by using a patient registry database will be more complicated than the other types of dataset. Since the handling of patient registry data is a challenging task, the authors have come out with this e-book/book to become a guideline for the statisticians, medical officers and scientists for them to refer as a handbook whenever they need to use patient registry data for their research.

**Registries for Evaluating Patient Outcomes** Agency for Healthcare Research and Quality/AHRQ,2014-04-01 This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

**Nuclear Cardiology: The Basics** Frans J. Th. Wackers,Wendy Bruni,Barry Zaret,2003-09-11 In the United States the performance of nuclear cardiology studies continues to increase. As an example, in 1998, 4,160,739 myocardial perfusion imaging studies were done. In 2001 this number increased to 5,679,258. The nonhospital performance of perfusion imaging increased over the same time period from 1,188,731 to 1,789,207 studies (Arlington Medical Resources data). In 1999, there were approximately 1300 nonhospital sites with nuclear imaging capabilities, of which 600 were in physician's offices. By 2001, there were approximately 1700 nonhospital sites, of which 780 were in physician's offices (from IMV, LTD: <http://www.imvlimited.com/mid/>). The growth of nuclear cardiology as an expanded outpatient laboratory enterprise is readily apparent. In the United States, as well as in other parts of the world, this growth has been linked to the recognition of the ability of cardiologists to perform these studies. The certification examination in nuclear cardiology is now well established in the United States. Accreditation of laboratories is also well established. Over the years, some of the most frequent questions asked by our former trainees relate to practical issues involved in the establishment of a nuclear

cardiology laboratory. In view of the growth of the field, this is certainly not surprising.

**Race, Ethnicity, and Language Data** Institute of Medicine, Board on Health Care Services, Subcommittee on Standardized Collection of Race/Ethnicity Data for Healthcare Quality Improvement, 2009-12-30 The goal of eliminating disparities in health care in the United States remains elusive. Even as quality improves on specific measures, disparities often persist. Addressing these disparities must begin with the fundamental step of bringing the nature of the disparities and the groups at risk for those disparities to light by collecting health care quality information stratified by race, ethnicity and language data. Then attention can be focused on where interventions might be best applied, and on planning and evaluating those efforts to inform the development of policy and the application of resources. A lack of standardization of categories for race, ethnicity, and language data has been suggested as one obstacle to achieving more widespread collection and utilization of these data. *Race, Ethnicity, and Language Data* identifies current models for collecting and coding race, ethnicity, and language data; reviews challenges involved in obtaining these data, and makes recommendations for a nationally standardized approach for use in health care quality improvement.
